SUMMARY

Full-Stack Software Engineer with 3+ years of professional and freelance experience, specializing in building end-to-end web applications. I possess comprehensive expertise in both front-end and back-end development, with a strong focus on architecting scalable solutions and optimizing the full software development lifecycle. My career is dedicated to delivering high-quality, user-centric products while collaborating with stakeholders to transform requirements into reliable and performant software.

WORK EXPERIENCE

Full-Stack Developer | Vertex Technologies (TIMES) **05/2026 – Present**

- Built the frontend and API integration layer of TIMES, an e-invoicing and ERP platform for VAT compliant businesses, connecting a Next.js app to Golang microservices (auth, invoicing, inventory, analytics) through a unified API gateway.
- Delivered live financial dashboards (sales performance, tax liability, receivables aging) and print ready, multilingual invoice and receipt templates that meet the government e-invoicing (EIMS) requirements.
- Created a unified design system with shadcn/ui and Tailwind for the platform's web apps, including mobile responsive layouts that leave the desktop experience unchanged.

Software Engineer (Contract) | Anuva Capital **03/2026 – Present**

- Migrated a live Dynamics 365 / Leasepath book of business (about 100GB, with notes and attachments) to self-hosted SuiteCRM before the renewal deadline, using a Go client on the Dynamics Web API, and rebuilt Opportunity relationships so years of deal history appear as working subpanels.
- Replaced Dynamics process emails with 13 live SuiteCRM workflows on SendGrid, and rebuilt document generation with 46 Word templates (sales proposals and funder lease packages) that fill from deal data and file a copy on the record.
- Shipped the public Apply Now portal, a 4 step credit application that creates the Account, Contacts and Opportunity and emails the assigned sales rep.

Backend Developer | Pioneer Labs **01/2026 – 06/2026**

- Migrated tenant and user data from Firebase/Firestore to PostgreSQL for a multi-tenant SaaS mailer.
- Decoupled the service from Firestore by replacing direct reads with a CRM HTTP API adapter for tenant identity resolution.
- Designed the Postgres schema and wrote the migration scripts that support the new data layer.

Full-Stack Developer | IP Guestlist Application **03/2024 – 08/2025**

- Built a VIP Guestlist Management Platform that streamlines exclusive event applications and gives administrators one place to review, approve and manage applicants.
- Ran bulk email and SMS campaigns with SendGrid and Twilio, bringing in **over 2000 users**.
- Implemented duplicate detection, priority tagging and conflict resolution to keep applicant data clean and let admins focus on the highest value applicants.

SKILLS

Golang, Microservices, gRPC, Kafka, Temporal, PostgreSQL, MySQL, Redis, Docker, JavaScript, TypeScript, Next.js, React, Tailwind CSS, shadcn/ui, MERN, SuiteCRM, Dynamics 365, SendGrid

EDUCATION

BSc in Computer Science | University Of Gondar

- Graduated: 07/2025
